

Rippling is a multi-product platform and the infra team takes care of the core framework underneath these products. The codebase is written in Python. The core framework here could mean the request middleware, logging framework, a homegrown background job processing framework (similar to celery but getting much more sophisticated), cli tools, dashboards for application health, intelligent diff detector to find the tests to run, codegen for typescript models based on python meta-programming , etc.

We, the infra team of six engineers, help more than hundred engineers in India and the US to run faster and safer. We love high-quality engineering. We are experienced, from good companies and love deep technical work. We are humble and learn from the mistakes.

We are looking for Pythonistas with strong tech chops to build frameworks, optimize and find innovative-yet-simple solutions to growing problems that arise as Rippling scales multifold.

They should command respect from the engineers, guide them, help them debug, understand their *true* needs and build solutions. Most of the code you write will be business agnostic hence it could be open sourced. It would be great if you have interest in open source and want to evangelise.

Some solutions would demand knowledge across the entire stack i.e. how the code is scaled, deployed and monitored. So knowledge of containers, deployment, instrumentation, etc. would make you more effective. Not a problem if you don't have exposure as long as you are willing to learn.

If you are inclined towards solving deep technical problems, obsessive about developer productivity, you will find this role a joy ride. The job location is based in India and the US. Apply [here](#) or drop an email to [senthil at rippling dot com](mailto:senthil@rippling.com)
